

7.7.8 (Non-Platform)

Release Date: August 26th - Data Warehouse & Security

What's New in This Release

This non-platform release strengthens the Snowflake data warehouse with faster data syncing, tighter security, and self-service user management, plus streamlined setup for Camvio Data MCP access.

New Features & Enhancements

Data Warehouse

- **Faster Data Sync for Reporting and the Data Agent:** Select account and service data now syncs to Snowflake on an hourly basis instead of daily, so reports and the Camvio Data Agent reflect more current information.
- **Multi-Factor Authentication for Data Warehouse Access:** Access to the Snowflake data warehouse now requires multi-factor authentication, adding an extra layer of protection for reporting and analytics users.
- **Self-Service User Administration:** Customers can now designate one or more of their own users as a user admin, letting them manage who on their team has data warehouse access without needing to contact Camvio support.
- **Streamlined Camvio Data MCP Access:** Camvio Data MCP access is now provisioned automatically as part of onboarding, so every new customer account is set up consistently from day one. New documentation walks end users through getting started.
